OFFLINE-FIRST SECURITY ENGINEERING

VNAGY Use Case — Public Sector Operational Stability Monitoring

Document ID: VNAGY-UCPSOS-005

Version: v1.0

Revision History:

Version	Date	Author	Description
V1.0	19 August 2026	V. Nađ	Draft

Document Status: Internal Technical Specification

Prepared by: VNAGY Security Engineering

Reviewed by: V. Nađ — Internal Peer Review

Table of Contents

1. Executive Summary

This document outlines how **VNAGY** conceptually supports public sector environments by detecting anomalies in operational processes, access patterns, and system behavior. **VNAGY** operates offline-first and does not require integration with government systems.

2. Business Context

Public sector systems require stability, transparency, and predictable operational behavior. Behavioral anomalies may indicate system misuse, unauthorized access, or operational disruption.

3. Problem Statement

Typical behavioral risks in public sector systems include:

- Irregular access patterns
- Unexpected process lineage
- Abnormal timing profiles
- Network bursts to unknown destinations
- Memory-only processes interacting with critical modules

4. VNAGY Role

VNAGY:

- Analyzes operational behavior
- Correlates heuristics across multiple signal sources
- Detects deviations from normal public sector workflows
- Assigns deterministic risk levels
- Operates offline-first without integration

5. Workflow Overview

- A public sector system generates an event.
- **VNAGY** collects the signal locally.
- Heuristics evaluate behavioral deviation.
- **VNAGY** assigns a risk level.
- The system receives a recommendation.

6. Expected Outcomes

- Early anomaly detection
- Reduced operational risk
- Improved auditability
- Increased transparency
- Enhanced stability

7. Risk Reduction

VNAGY reduces:

- Operational risk
- Security risk
- Regulatory risk
- Reputational risk

8. Conclusion

VNAGY provides stable, predictable, and secure behavior-driven analysis for financial environments without integration or access to sensitive data.
