1. Policy Identifier

VNAGY-BEC-005 — AI Isolation Policy

VNAGY

2. Constraint Statement

This document defines the conceptual boundaries, symbolic behavior limits, and deterministic constraints governing the **VNAGY** Behavior Engine (BEC). It does **not** define operational logic, dynamic behavior, algorithms, thresholds, or reconstructable decision processes.

VNAGY

3. Mandatory Rules

- The engine **MUST** operate exclusively on symbolic, non-numeric, non-predictive representations.
- All behavior transitions **MUST** remain deterministic under identical symbolic conditions.
- Internal behavior states **MUST** remain isolated, non-exposed, and non-derivable.
- The engine **MUST NOT** rely on external systems, networks, or dynamic runtime data.
- All behavior outputs **MUST** remain offline-valid and locally resolvable.

4. Prohibited Actions

- The engine **MUST NOT** perform machine-learning, pattern recognition, or predictive modeling.
- The engine **MUST NOT** expose internal behavior logic, decision paths, or reconstructable state transitions.
- The engine **MUST NOT** define numeric thresholds, weights, or statistical operations.
- The engine **MUST NOT** depend on entropy sources, randomness, or runtime variability.
- The engine **MUST NOT** produce operational or actionable decisions.
- The engine **MUST NOT** rely on external systems, networks, or dynamic runtime data.

5. Allowed Actions

- The engine **MAY** use symbolic tokens to represent conceptual behavior states.
- The engine **MAY** define deterministic symbolic transitions between states.
- The engine **MAY** output non-operational, advisory, symbolic behavior indicators.

VNAGY

6. Interaction Boundaries

- All behavior **SHALL** remain symbolic, deterministic, and non-numeric.
- No reconstructable logic **SHALL** be present.
- No operational linkage to other modules **SHALL** exist.
- Behavior outputs **SHALL** remain advisory, non-actionable, and non-binding.

VNAGY

7. Enforcement Notes

- Any violation of symbolic, deterministic, or non-operational constraints invalidates BEC compliance.
- Non-compliant implementations **SHALL** be excluded from **VNAGY** integration.

8. Non-Operational Clause

This specification defines no algorithms, no thresholds, no numeric scoring, and no reconstructable decision logic. It is strictly conceptual and normative.

VNAGY

9. Licensing Reference

Subject to **VNAGY-PSDL-1.3** licensing constraints.

10. Normative References

The following documents define the normative meaning of requirement keywords and provide the authoritative basis for **MUST**, **MUST NOT**, **SHOULD**, **SHOULD NOT**, and **MAY**:

- **RFC 2119** — Key Words for Use in RFCs to Indicate Requirement Levels
- **RFC 8174** — Clarification of Normative Language
- **ISO/IEC 27001** — Information Security Management Systems
- **ISO/IEC 27002** — Code of Practice for Information Security Controls
- **NIST SP 800-53** — Security and Privacy Controls for Information Systems
- **NIST SP 800-63** — Digital Identity Guidelines
- **MITRE ATT&CK Framework** — Enterprise Matrix
- **Microsoft SDL** — Secure Development Lifecycle Guidelines
- **Kubernetes API Conventions** — SIG Architecture
- **Rust API Guidelines** — Official Rust Documentation
- **Python PEP 8** — Style Guide for Python Code

11. Informative References

The following documents provide background context and supplementary guidance. They do not define mandatory requirements:

- **VNAGY Secure-First Conceptual Architecture Specification**
- **VNAGY Coding Standard Specification**
- **VNAGY Minimal License (PSDL-1.3)**
- **VNAGY CC BY-NC 4.0 Extended License**
- **OWASP Secure Coding Practices**
- **CAPEC — Common Attack Pattern Enumeration and Classification**
- **ISO/IEC 25010 — System and Software Quality Models**

12. Normative Keyword Usage

This specification uses the normative keywords **MUST**, **MUST NOT**, **SHOULD**, **SHOULD NOT**, and **MAY** as defined in **RFC 2119** and clarified in **RFC 8174**. These keywords indicate requirement levels within this document.
